Reasons for Allowance

1. **Status of Claims:** An Examiner's Answer was mailed on 3/30/10 in which claims 1-3, 5-8, and 10-16 were under appeal. Claims 4 and 9 were objected to in the Final action 4/26/09. The Applicant has amended claims 4 and 9 into independent form. In the Applicant's Reply Brief dated 4/27/10, the Applicant has cancelled claims 1-3, 5-8, and 10-16.

2. Claims 4 and 9 are allowable.

3. The following is an examiner's statement of reasons for allowance: listed below:

Any comments considered necessary by applicant must be submitted no later than the payment of the issue fee and, to avoid processing delays, should preferably accompany the issue fee. Such submissions should be clearly labeled "Comments on Statement of Reasons for Allowance."

4. Prior art fails to suggest or disclose, "interrogating a plurality of boot devices within a data processing system in sequence according to a priority order until a boot device supplies a device password", and example of prior art that fails to disclose or suggest, "interrogating a plurality of boot devices within a data processing system in sequence according to a priority order until a boot device supplies a device password", is Pearce. Pearce discloses when the computer system boot, system management mode software is invoked which powers on the hard drive and reads the unique drive identification information from the hard drive. The drive identification of Pearce discloses a manufacturer identification and drive serial number. Pearce discloses that the hard drive is integrated drive electronics, and that each drive includes drive identification information. Pearce discloses the unique identification information is used to ensure that a drive different than the drive used to boot the computer system is not inserted into

the computer system. Pearce discloses during booting, the SMM software posers on the hard drive and the SMM software reads the drive identification information on the hard drive. Pearce discloses the SMM software compares the drive identification information received from the drive currently in the computer system with the drive identification information stored by the SMM software in the system memory during boot. Although, Pearce discloses that the boot device supplies the device password, Pearce does not disclose “interrogating a plurality of boot devices within a data processing system in sequence according to a priority order until a boot device supplies a device password”. Pearce only discloses one boot device which is the hard drive that is interrogated with a password which is the manufacturer identification and drive serial number.

5. Prior art fails to disclose or suggest, “interrogating a plurality of boot devices within a data processing system in sequence according to a priority order until a boot device supplies a device password, the booting said data processing system utilizing said boot device without the entry of any device password corresponding to that of said trusted boot device by a human user”, is Carroll. Carroll discloses the personal computer includes a hard disk and a floppy disk. Carroll discloses that the ROM further includes BIOS that is used by the CPU to perform preliminary tasks and allows the CPU to locate and execute the operating system code stored in one of the disks when the CPU first boots. Carroll discloses the CPU checks each disk, in order, to see if the disk is bootable, and the disk allows the CPU to load and execute an operating system stored thereon. There is no disclosure or suggestion of a password in Carroll. Further, Carroll fails to disclose or suggest, “interrogating a plurality of boot devices within a data processing system in sequence according to a priority order until a boot device supplies a device

password, the booting said data processing system utilizing said boot device without the entry of any device password corresponding to that of said trusted boot device by a human user”.
